

Why have the first quantum information processing experiments been performed with photons?

- Preparation of single photon states by attenuation
- Detection with high efficiency (single photon detectors)
- Manipulation of polarization / path (phase shifter, beam splitter, mirror, ...)

→ well developed for photons!

Also: only weak interaction with environment  
(long coherence time, long-distance transmission)

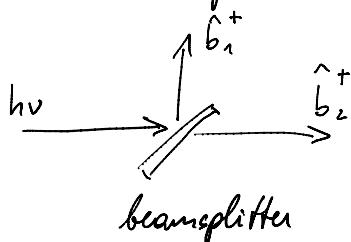

BUT: photon-photon interaction also weak  
⇒ impractical for 2-qubit gates

# Photon qubits for Quantum Communication:

(e.g. Koh & Lovett - Optical Quantum Inf. Proc.)

e.g. using polarisation + spatial degree of freedom

spatial modes:

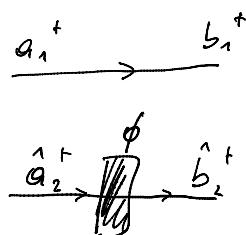

$b_1, b_2$  - spatial modes

$$\begin{aligned} |0\rangle &= b_1^+ |0\rangle, |0\rangle_2 = b_1^+ |0,0\rangle = |1,0\rangle \\ &\quad \text{photons in mode 1} \end{aligned} \quad \left. \begin{aligned} |1\rangle &= b_2^+ |0,0\rangle = |0,1\rangle \end{aligned} \right\} \text{"dual rail representation"}$$

operations:

phase shifter

(dielectric with  
refractive index  $n_h \neq 1$ )

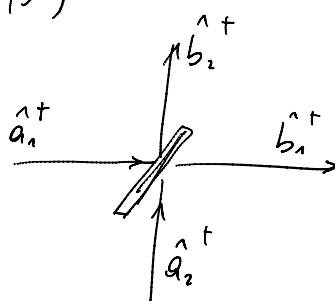

$$a_1^+ \rightarrow b_1^+$$

$$a_2^+ \rightarrow e^{i\phi} b_2^+$$

$$\begin{pmatrix} a_1^+ \\ a_2^+ \end{pmatrix} \rightarrow \begin{pmatrix} 1 & 0 \\ 0 & e^{i\phi} \end{pmatrix} \begin{pmatrix} b_1^+ \\ b_2^+ \end{pmatrix}$$

beam splitter (50/50)

(half silvered  
mirror)

$$\begin{aligned}\hat{a}_1^+ &\xrightarrow{\text{BS}} \frac{1}{\sqrt{2}} (b_1^+ + b_2^+) \\ \hat{a}_2^+ &\xrightarrow{\text{BS}} \frac{1}{\sqrt{2}} (-b_1^+ + b_2^+)\end{aligned}$$

minus sign:  
reflected beam gets  
phase shift; unitary  
transformation

$$\begin{pmatrix} \hat{a}_1^+ \\ \hat{a}_2^+ \end{pmatrix} = \frac{1}{\sqrt{2}} \begin{pmatrix} 1 & 1 \\ -1 & 1 \end{pmatrix} \begin{pmatrix} b_1^+ \\ b_2^+ \end{pmatrix}$$

Example: photon at input 1:

$$\begin{aligned}|0\rangle &= |1,0\rangle = \hat{a}_1^+ |0,0\rangle \xrightarrow{\text{BS}} \frac{1}{\sqrt{2}} (b_1^+ + b_2^+) |0,0\rangle \\ &= \frac{1}{\sqrt{2}} (|1,0\rangle + |0,1\rangle) = \\ &= \frac{1}{\sqrt{2}} (|0\rangle + |1\rangle)\end{aligned}$$

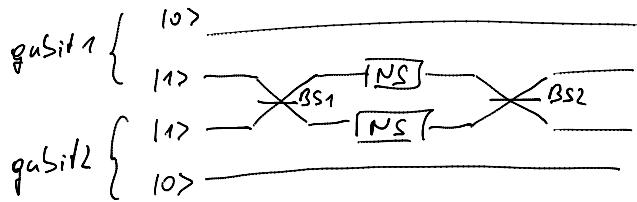

$\rightarrow$  50/50 beamsplitter: 50% probability for scattering into either output port

photons at input 1 & 2: (Hong-Ou-Mandel)

$$\begin{aligned}\hat{a}_1^+ \hat{a}_2^+ |0\rangle_1 |0\rangle_2 &\rightarrow \frac{1}{2} (b_1^+ b_2^+ + b_2^+ b_1^+) |0\rangle_1 |0\rangle_2 = \\ &= \frac{1}{2} \cancel{(b_1^+ b_1^+ + b_2^+ b_1^+ - b_1^+ b_2^+ - b_2^+ b_2^+)} |0\rangle_1 |0\rangle_2 = \\ &= \frac{\cancel{1}}{2} \underline{(-|2\rangle_1 |0\rangle_2 + |0\rangle_1 |2\rangle_2)} \\ &\rightarrow \text{perfect antibunching}\end{aligned}$$

$\circlearrowleft$  destructive interference of  
 $\downarrow$  &  $\downarrow$

## (Non-deterministic) C-Phase gate:

non-linear sign gate (NS)  $\alpha|0\rangle + \beta|1\rangle, \gamma|2\rangle \rightarrow \alpha|0\rangle, \beta|1\rangle - \gamma|2\rangle$

induced by  
 \*) non-linearity  
 \*) non-deterministically (success prob 25%)

operation:  $|100\rangle_L = |1001\rangle \xrightarrow{BS+NS+BS2} |100\rangle_L$   
 (no two photons @ NS gates)

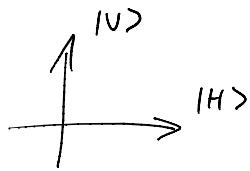

$$|101\rangle_L = |1010\rangle \longrightarrow |101\rangle_L$$

$$|10\rangle_L = |0101\rangle \longrightarrow |10\rangle_L$$

$$\begin{aligned} |11\rangle_L &= |0110\rangle \xrightarrow{BS_1} |0\rangle \otimes \frac{1}{\sqrt{2}}(|10\rangle + |02\rangle) \otimes |0\rangle \\ &\xrightarrow{NS} -|0\rangle \otimes \frac{1}{\sqrt{2}}(|10\rangle + |20\rangle) \otimes |0\rangle \\ &\xrightarrow{BS_2} -|0110\rangle = -|11\rangle_L \\ &\text{(bunching)} \end{aligned}$$

success probability:  $\left(\frac{1}{4}\right)^2 \cdot \frac{1}{16}$

polarization basis:

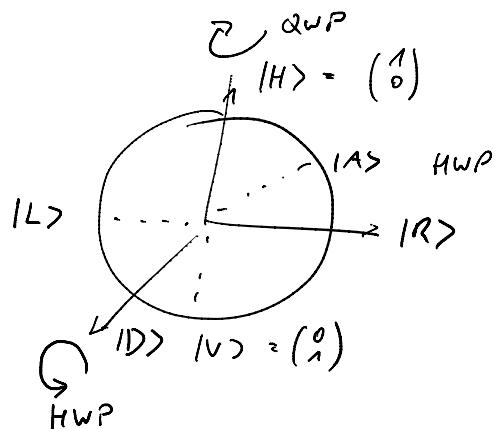

$a_H^+$  ... creation of photon in mode a with horizontal pol.

$a_V^+$  ... \_\_\_\_\_ - \_\_\_\_\_ vertical pol.

$$|0\rangle = a_H^+ |0,0\rangle_{HV} = |1,0\rangle_{HV} = |H\rangle$$

$$|1\rangle = a_V^+ |0,0\rangle_{HV} = |0,1\rangle_{HV} = |V\rangle$$

$$|L\rangle = \frac{1}{\sqrt{2}} (|H\rangle + i|V\rangle)$$

$$|R\rangle = \frac{1}{\sqrt{2}} (|H\rangle - i|V\rangle)$$

$$|D\rangle = \frac{1}{\sqrt{2}} (|H\rangle + |V\rangle)$$

$$|A\rangle = \frac{1}{\sqrt{2}} (|H\rangle - |V\rangle)$$

Operations:

half-wave plate:  $|H\rangle \rightarrow \cos 2\theta |H\rangle + i \sin 2\theta |V\rangle$   
 $|V\rangle \rightarrow i \sin 2\theta |H\rangle + \cos 2\theta |V\rangle$

$$U_{HWP}(\theta) = \begin{pmatrix} \cos 2\theta & i \sin 2\theta \\ i \sin 2\theta & \cos 2\theta \end{pmatrix}$$

$\Rightarrow$  rotation about x-axis

$$\theta = \frac{\pi}{4}: \quad U_{HWP} = e^{i\frac{\pi}{2}} \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix} = X$$

$$|V\rangle \rightarrow |H\rangle ; \quad |H\rangle \rightarrow |V\rangle$$

quarter wave plate:  $\phi_f - \phi_s = \frac{\pi}{2}$        $\theta = \frac{\pi}{4}$   
 $U_{QWP} = e^{-i\frac{\pi}{4}} \begin{pmatrix} 1 & 0 \\ 0 & i \end{pmatrix} = \frac{1}{\sqrt{2}} \begin{pmatrix} 1 \\ i \end{pmatrix}$

$\Rightarrow$  rotation about z-axis

$$|L\rangle = \frac{1}{\sqrt{2}} (|H\rangle + i|V\rangle) = \frac{1}{\sqrt{2}} \begin{pmatrix} 1 \\ i \end{pmatrix}$$

$$U_{QWP}|L\rangle \rightarrow e^{-i\frac{\pi}{4}} (|H\rangle - |V\rangle) \propto |A\rangle$$

$\rightarrow$  transforms linear  $\leftrightarrow$  circular transformation

$\rightarrow \frac{1}{2} + \frac{\lambda}{4}$  wave plates are sufficient to create arbitrary single-qubit operations!

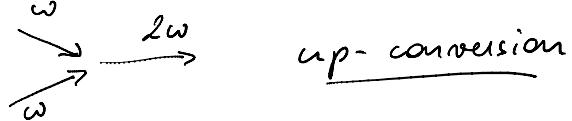

## Parametric Down Conversion

for creation of entangled photon pairs

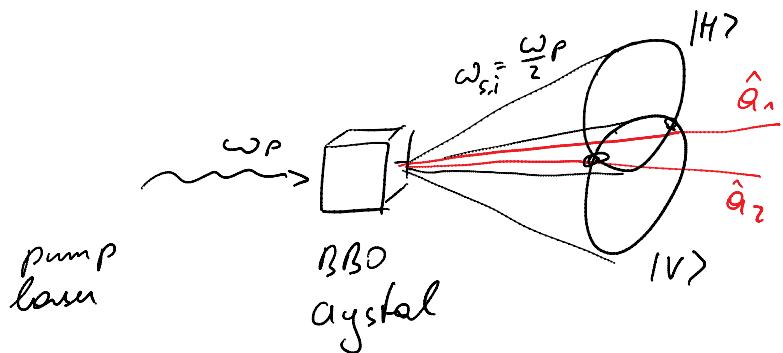

due to non-linear response of medium to electric field

$$\text{polarization } P = \epsilon_0 (xE + x^{(2)}E^2 + x^{(3)}E^3 + \dots)$$

$$\text{for } E(x, t) = E_0 e^{i(kx - \omega t)} \Rightarrow x^{(2)}E^2 \propto e^{-2i\omega t}$$

reverse process: down-conversion:

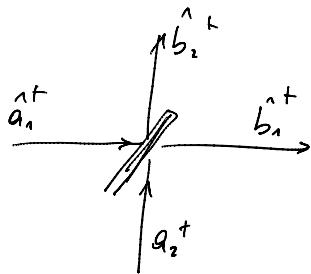

conservation of  
 • energy ( $\omega_p = \omega_s + \omega_i$ )  
 • momentum ( $\vec{k}_p = \vec{k}_s + \vec{k}_i$ )

$$\text{at crossing points: } |\Psi\rangle = \frac{1}{\sqrt{2}} (|H\rangle_1 |V\rangle_2 - |V\rangle_1 |H\rangle_2)$$

anti-symmetric Bell state

## Bell State measurement using 50/50 beamsplitter

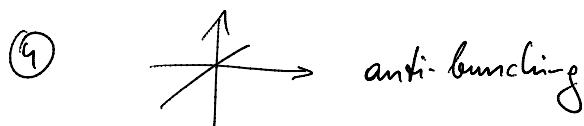

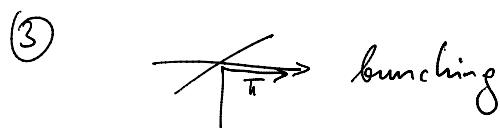

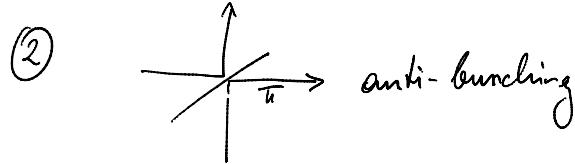

$$\hat{a}_1^{(t)} \xrightarrow{\text{BS}} \frac{1}{\sqrt{2}} (\hat{b}_1^{(t)} + \hat{b}_2^{(t)})$$

$$\hat{a}_2^{(t)} \xrightarrow{\text{BS}} \frac{1}{\sqrt{2}} (-\hat{b}_1^{(t)} + \hat{b}_2^{(t)})$$

two photons incident on the beam splitter:

4 possibilities : ①

Mong-Ou Mandel effect: for identical polarization ( $\Phi^\pm = \frac{1}{\sqrt{2}}(|HH\rangle \pm |VV\rangle)$ )

→ destructive interference

due to phase shift  $0$  or  $\pi$

⇒ bunching

cannot be distinguished

BUT: anti-bunching for anti-symmetric state  
 $|4\rangle = \frac{1}{\sqrt{2}} (|HV\rangle - |VH\rangle)$ !

input state:  $(\hat{v}_i = \hat{a}_{iv}, \hat{h}_i = \hat{a}_{iH}) \xrightarrow{\frac{1}{\sqrt{2}}} \left( h_1^+ v_2^+ \mp v_1^+ h_2^+ \right)$   
 "apply beam splitter transformation to each mode"

$$\begin{aligned} & \left[ \frac{1}{2} \frac{1}{\sqrt{2}} (h_1^+ + h_2^+) (v_2^+ - v_1^+) \mp (v_1^+ + v_2^+) (h_2^+ - h_1^+) \right] = \\ & = \frac{1}{2\sqrt{2}} \left[ \underline{h_1^+ v_2^+} + \underline{h_2^+ v_2^+} - \underline{h_1^+ v_1^+} - \underline{h_2^+ v_1^+} \mp \underline{v_1^+ h_2^+} \mp \underline{v_2^+ h_2^+} \pm \underline{v_1^+ h_1^+} \pm \underline{v_2^+ h_1^+} \right] \end{aligned}$$

for anti-symmetric spatial wavefunction (-): "~~~"

$$= \frac{1}{\sqrt{2}} (h_1^+ v_2^+ - v_1^+ h_2^+) \Rightarrow \text{anti-bunching} \quad \nearrow \begin{matrix} H/V \\ v/H \end{matrix}$$

for symmetric spatial wavefunction (+): "—"

$$= \frac{1}{\sqrt{2}} (-h_1^+ v_1^+ + h_2^+ v_2^+) \Rightarrow \text{bunching} \quad \nearrow \begin{matrix} H/V \\ v/H \end{matrix} \text{ oder} \quad \nearrow \begin{matrix} H/V \\ v/H \end{matrix}$$

bunching also for other symmetric spatial wavefunctions  $\left[ \frac{1}{\sqrt{2}} (h_1^+ h_2^+ \pm v_1^+ v_2^+) \right]$

$$\left[ \frac{1}{\sqrt{2}} (h_1^+ h_2^+ \pm v_2^+ v_1^+) \right] \Rightarrow \text{bunching}$$

## Super Dense Coding:

1) Preparation of initial entangled state (PDC)

$$|4^+\rangle = \frac{1}{\sqrt{2}} (|HH\rangle + |VV\rangle)$$

2) Generation of 4 maximally entangled 2 photon polarization states

$$|4^+\rangle \xrightarrow{A_1} |4^+\rangle$$

$$|4^+\rangle \xrightarrow{X_1} \frac{1}{\sqrt{2}} (|HH\rangle + |VV\rangle) = |\phi^+\rangle \quad (\text{HWP})$$

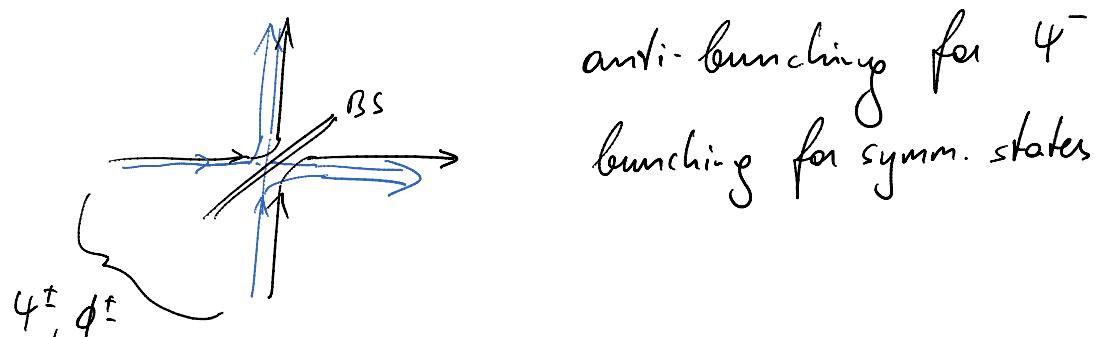

(i) ... omitted

$$|4^+\rangle \xrightarrow{Z_2} \frac{1}{\sqrt{2}} (|HV\rangle - |VH\rangle) = |4^-\rangle \quad (\text{QWP})$$

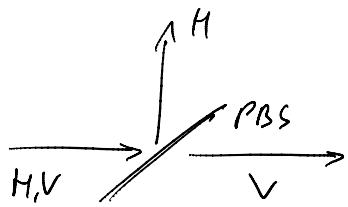

$$|4^+\rangle \xrightarrow{Z_2 X_1} \frac{1}{\sqrt{2}} (|HH\rangle - |VV\rangle) = |\phi^-\rangle \quad (\text{HWP+QWP})$$

3) Bell State measurement using beam splitter

A) distinguish symmetric ( $|4^+\rangle, |\phi^+\rangle, |\phi^-\rangle$ ) from antisymmetric ( $|4^-\rangle$ ) state using a beam splitter (BS)

B) distinguish polarization states using polarizing beam splitter

outcomes:  $|H^+\rangle$ : coincidence  $D_H \& D_V$  or  $D_{H'} \& D_{V'}$

$|H^-\rangle$ : coincidence  $D_{H'} \& D_V$  or  $D_H \& D_{V'}$

$|H^+\rangle, |H^-\rangle$ : 2 photons in  $D_H, D_V, D_{H'}, D_{V'}$   
(cannot be distinguished)
